Abstract of EP1069694

Known telecommunication systems comprising a controller (gateway/server) and devices (TV, VCR, refrigerator, security system) and a remote control unit for remotely controlling said devices via said controller, can be made more flexible and more user-friendly by allowing an interface like a user-interface and/or a device-interface to be downloaded into said remote control unit, in response to a trigger-signal comprising a user-identification and/or a device-identification generated due to a user operating said remote control unit or generated due to an interface-amendment reported to said system.
